Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-: SUBUNIT: Binds PLEKHA1 and PLEKHA2 through its first PDZ domain

-: SUBUNIT: Binds PLEKHA1 and PLEKHA2 through its first PDZ domain.

-: SUBUNIT: Binds PLEKHA1 and PLEKHA2 through its receptor)

-: SUBCHILLIAN LOCATION: Obtains the second and fourth PDZ domains.

-: SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-: SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-: SIMILARITY: Belongs to the protein-tyrosine phosphatase family.

Non-receptor class subfamily.

-: SIMILARITY: Contains 5 PDZ/DHR domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=98155214; PubMed=9487134; Cuppen E., Gerrits H., Pepers B., Wieringa B., Hendriks W.; Papers B., Morife in Prb-BL and RIL bind to internal protein segments in the LIM domain protein RIL."; Mol. 861. -!- FUNCTION: Regulates negatively FAS-induced apoptosis and NGFR-

tyrosine + phosphate.

SUBUNIT: Interacts with TRIP6 and TNFRSF6 (Fas receptor) through its second PDZ domain. Interacts with the C-terminal SVP motif of NGFR through its third PDZ domain. Interacts with the LIM domain of PDLIM4 through its second and fourth PDZ domains. Binds PLEKHAI and PLEKHAZ through its first PDZ domain.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

ALTERNATIVE PRODUCTS: mediated pro-apoptotic signaling. CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein

Event=Alternative splicing; Named isoforms=4;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

protein-tyrosine-phosphatase (BC 3.1.3.48), nonreceptor type 13 - mouse
NyAlternate names: epidernal growth factor-binding protein; serine proteinase
C;Species: Was musculus (house mouse)
C;Species: Mas musculus (house mouse)
C;Accession: S71625; S67987; I81210; I81209; S40290
E;Chda, D.; Kume, T.; Mukouyama, Y.; Tabata, S.; Nomura, N.; Thomas, M.L.; Watanabe, PBS Lett. 358, 233-239, 1995
A;Title: Characterization of a protein tyrosine phosphatase (RIP) expressed at a very excession: S71625; MUID:95145716; PMID:7843407
A;Molecule type: mRNA

New nucleic acid encoding specific protein tyrosine phosphatases - useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease.

Claim 2; Page 158-160; 193pp; English.

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify

```
substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therety (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                         121 IVKKSTGKSQCVKHLQFTKWPDHGTPASADFFIKYVRYVRKSHITGPLLVHCSAGVGRTG 180

continue present invention describes isolated, enriched or published muciello acids encoding PTPOS, PTPOS, PTPOS, PTPOS, PTPOS acids encoding PTPOS, TPTPOS, PTPOS. The above proteins. The present sequence represents mouse PTPOS. The above proteins, other than a protein tyrosine phosphatases (PTPS) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, concluding NBP) in vivo or in vitro. These substances are used to identify prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukamia and tymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, corrine/threonine kinase) are used to promote neuronal survival, corrine/threonine kinase) are used to promote neuronal survival, correcting can be used as probes to identify and clone related sequences; conceins can be used as probes to identify and clone related sequences; therapy (optionally after mutation). Ab are used to determine the

that involve the proteins, particularly cancer (e.g. leakaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzahemer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA, to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                       The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways
                                                                                                                                                                                                                                                            identifying specific modulators for treatment and prevention of

gout, Graves disease, Hashimoto's thyroiditis, irritable bowel syndrome, multiple sclerosis, osteoarthritis, osteoporosis, pancreatitis, Reiter's syndrome, rheumatoid arthritis, Sjogren's syndrome, uveitis), or viral, bacterial, fungal, parasitic, protozoan or helminthic infections. The KPP is useful in assessing the effects of exogenous compounds on the expression of nucleic acids and kinases and phosphatases. KPP gene is useful in gene therapy and for creating transgenic animals to model human disease. The present sequence is human KPP protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VLENNCNVIAMITREIECGVIKCYSYWPISLKEPLEFEHFSVFLETFHVTQYFTVRVFQI 121
